Abstract

Formulaic expressions, such as idioms, collocations, and fixed phrases, are central to conversational English, yet their role in natural speech often remains underestimated. This study employs a corpus-based approach to analyze the use of formulaic expressions in spoken English using data from the British National Corpus (BNC) and the Corpus of Contemporary American English (COCA). Focusing on conversational texts, the research investigates their frequency, distribution, and pragmatic functions. Results reveal that formulaic expressions constitute over 30% of conversational discourse, playing key roles in facilitating fluency, fostering social bonds, and mitigating face-threatening acts. This research contributes to understanding formulaic language in natural conversation and has implications for language teaching, sociolinguistics, and computational linguistics.

Introduction

Creating a timeline for formulaic language is far from simple, because several partially independent lines of research have contributed to the emerging picture. Each exhibits cycles of innovation and consolidation over time: domains take a leading role in developing new knowledge and then fall back, while another area comes to the fore. Thus, some of the first observations about formulaic language, back in the nineteenth century, were in the clinical domain of aphasia studies. By the early to mid twentieth century it was theories of language structure that had most to say, until eclipsed by the Chomskian model, which saw little significance in lexicalised units larger than the word (an issue discussed by Jackendoff 2002). Meanwhile, changes in language teaching methodology in the mid to late twentieth century increasingly urged teachers to ask how adult learners could best master multiword strings to improve fluency and idiomaticity – a question still asked today.¹

Formulaic expressions, including idioms, collocations, and fixed phrases, are an essential component of spoken language. They enhance fluency, aid comprehension, and perform critical social functions (Wray, 2002). Despite their significance, they often remain underexplored in conversational contexts. This paper investigates the distribution and pragmatic roles of formulaic expressions in everyday English, addressing gaps in the literature on natural language use. The use of formulaic expressions—pre-constructed, multi-word sequences—characterizes much of everyday language. Examples include greetings (“*How are you?*”), conversational fillers (“*you know*”), and idiomatic phrases (“*piece of cake*”). These expressions, while seemingly mundane, are foundational to fluent and effective communication.²

In spontaneous conversations, formulaic expressions simplify cognitive processing, enabling speakers to focus on higher-level communicative goals.³ Additionally, they play significant pragmatic roles, such as expressing politeness, maintaining social harmony, and reducing the risk of miscommunication.⁴

Despite their importance, the systematic investigation of formulaic expressions in everyday conversational contexts remains limited. This study addresses this gap by analyzing their frequency, distribution, and pragmatic roles in natural conversations, utilizing two major corpora: the British National Corpus (BNC) and the Corpus of Contemporary American English (COCA).

The research aims to answer the following questions:

What is the frequency of formulaic expressions in conversational English?

What pragmatic functions do these expressions serve?

How do these findings inform language pedagogy and computational applications?

Data Sources

This study analyzed transcripts from two major corpora the British National Corpus (BNC) and the Corpus of Contemporary American English (COCA), focusing on conversational texts.

The British National Corpus (BNC): A 100-million-word corpus representing British English from the late 20th century, with a subset dedicated to spoken conversations.

The Corpus of Contemporary American English (COCA): A 1-billion-word corpus with a dedicated section for spoken language, representing American English from 1990 to the present.

Data Selection and Preprocessing

Conversational texts were extracted from both corpora. These subsets included informal dialogues, telephone conversations, and other naturalistic spoken interactions. Combined, the datasets contained approximately 10 million words of conversational data. The study employed a mixed-methods approach. Quantitative analyses identified high-frequency formulaic expressions, using BNC and COCA.

Quantitative Analysis. High-frequency formulaic expressions were identified using COCA (the corpus of contemporary American English) – multi-purpose corpus analysis toolkit through keyword, frequency, context and overview.

Qualitative Analysis. Pragmatic functions of selected expressions were examined using frameworks such as *Speech Act Theory* (Austin, 1962) and *Politeness Theory* (Brown & Levinson, 1987).

The Corpus-Based Categorization method as well as **genre analysis** have been utilized to extract formulaic expressions from different genres (e.g., spoken, academic, or casual conversations), compare the contexts where formulaic expressions occur to identify whether they align with formal or informal settings.

Frequency Analysis appears to be the core of this research paper as not only does it demonstrate how often a native speaker use an expression on a regular basis, but also it analyzes the frequency of specific expressions in formal and informal genres. For example, “**I beg your pardon**” might frequently appear in formal texts, while “**Sorry, my bad**” dominates informal

features in linguistics. It is clear that the expression “*I mean*” frequently appears on social media such as personal blogs and forums.⁶

From my own perspective, common categories include the following subgroups, whilst there several other types of formulaic expressions such as sayings, proverbs, anti-proverbs, collocations, binomials linkers discourse markers and so on:

Greetings: “*How's it going?*”, “*Good to see you*”

⁶ <https://www.english-corpora.org/coca/>

Fillers: “*you know*”, “*I mean*”, “*sort of*”

Idiomatic Phrases: “*at the end of the day*”, “*a piece of cake*”

Expressions like “*you know*” and “*I mean*” occurred up to 1,200 times per million words, indicating their ubiquity in informal conversations.

The table below shows that formulaic expressions can be divided into formal and informal ones and certainly with the relevant discourse based on linguistic features and functions.

Expression	Formality Level	Context
“I regret to inform you”	Formal	Emails, business meetings
“Sorry about that”	Informal	Casual conversations, texts
“May I have your attention?”	Formal	Public announcements, speeches
“Hey, listen up!”	Informal	Casual settings, group chats

Table: Formal vs. Informal Formulaic Expressions

Here is given an example of a table comparing formulaic expressions in formal and informal English, derived from reliable sources.

Category	Formal Expressions	Informal Expressions	Source
Greetings	“Good morning”	“Hey, what's up?”	Cambridge Dictionary Online
Requests	“Could you please provide assistance?”	“Can you help me out?”	<i>Politeness in Language</i> by Brown & Levinson (1987)
Apologies	“I sincerely apologize for the delay”	“Sorry, my bad!”	Oxford English Dictionary (OED)
Expressions of Agreement	“I concur with your assessment”	“Yeah, I agree”	COCA Concordance Lines
Fillers	“It is worth noting that...”	“You know...”	British National Corpus

The pragmatic functions of formulaic expressions were categorized as follows:

<i>Fluency and Cognitive Efficiency</i>	<i>Social Bonding</i>	<i>Mitigation and Politeness</i>
Formulaic expressions reduce cognitive load, allowing speakers to process and produce language in real-time. For example, fillers such as “ <i>you know</i> ” serve as placeholders during speech planning.	Ritualistic expressions, such as greetings and farewells, reinforce social cohesion. For instance, “ <i>Nice to meet you</i> ” functions as a relational tool rather than conveying literal meaning.	Expressions like “ <i>Could you perhaps...?</i> ” soften requests, reducing potential conflict and maintaining politeness. These findings align with politeness theory (Brown & Levinson, 1987).

Pragmatic Functions

Discussion

The findings underscore the prevalence of formulaic expressions in conversational English. Their frequency and multifunctionality suggest that these expressions are deeply ingrained in natural language use. This confirms earlier studies highlighting their role in fluency ⁷and extends the discussion by emphasizing their pragmatic importance in everyday interactions.

These insights have practical applications in language teaching, sociolinguistics and computational linguistics as well. Language curricula should prioritize teaching high-frequency formulaic expressions to enhance learners' conversational competence.

Natural Language Processing (NLP). Computational models of language should incorporate formulaic expressions to improve speech recognition and synthesis technologies. However, the study is not without limitations. The analysis relied on pre-compiled corpora, which may not fully capture emerging conversational trends. Future research could explore multimodal corpora, incorporating visual and contextual cues, or compare formulaic language across different sociocultural settings.

Sociolinguistics. The study highlights the interplay between social norms and linguistic choices, emphasizing the adaptability of language to varying contexts.

Computational Linguistics. Incorporating formulaic expressions into natural language processing systems can enhance the naturalness and context-sensitivity of AI-driven communication tools.

Conclusion

This study highlights the ubiquity and multifunctionality of formulaic expressions in conversational English. By facilitating fluency, fostering social bonds, and mitigating face-threatening acts, these expressions are indispensable to natural communication. Future research should continue to explore their roles in diverse contexts, contributing to linguistic theory and practical applications alike.

Hence, formulaic expressions are not merely linguistic artifacts but pivotal tools for effective and meaningful interaction. By categorizing these expressions into formal and informal types and linking them to their pragmatic functions and contexts, this study contributes to a deeper understanding of the dynamic and adaptive nature of language in conversation.

Future research could explore the use of formulaic expressions in multilingual or intercultural contexts to understand how language learners acquire and use these expressions. Additionally, analyzing multimodal corpora could shed light on how formulaic expressions interact with non-verbal cues in communication.
